## Global Dialysis - Iron

Written by Katy Draper Friday, 18 June 2010 15:17

Many people on dialysis need both erythropoeitin and iron supplements to manage their anaemia.

If your iron levels are too low, erythropoeitin won't help and you'll continue to experience the effects of anaemia.

You may be able to take an iron pill alternatively iron is injected directly into an arm or into the tube that returns blood to your body during haemodialysis.
